Rapport fra Geoteknisk faggruppe.

Oppdrag: R.1143	Brattørgata - Forurensset grunn		
Trondheim den:	21.06.01		
Oppdragsgiver:	Intern	Oppdrag ved:	Ole-Ivar Folstad
Repr. punkt:	Tr. h. øst: 200	Tr. h. nord: 800	
Sted:	Brattørgt./Brattørveita	Antall tekstsider:	5
Feltarbeidet utført:		Antall bilag:	5
Feltmetoder:	Totalsondering	Prøveserier	
Emneord:	Jordarter	Forurensset grunn	
Saksbehandler:	Tone Furuberg <i>Tone Furuberg</i>	Kvalitetssikrer:	Stig Vognild <i>Stig Vognild</i>
Sammendrag: Det er planlagt å bygge parkeringskjeller i to nivå på eiendommene Brattørveita 19/21 og Brattørgata 10/12. I den forbindelse er det gjort grunnundersøkelser og tatt prøver for å bestemme innhold av tungmetall og PAH. Grunnen består av lagdelt sand, grus og noe silt. Grunnvannet står på kote 0 og dybde til fjell er stor. Bunnen av byggegropa vil være nær grunnvannsspeilet. Utgravingen må spundes. Det er generelt gode grave- og fundamenteringsforhold på tomta. Mye av massene på tomta er innfylt. Det kan være bygningsavfall eller lignende i de innfylte massene selv om dette ikke ble påtruffet i sonderingene. Forurensning er først og fremst knyttet til hull 3 hvor innholdet av PAH og B(a)P i prøven fra 1 til 2 meter er hhv 5 og 7 ganger høyere enn SFT sin norm for mest følsomt arealbruk. Massene nærmest hull 3 må kjøres til mellomager før endelig deponering. Det tas blandeprøver fra massene for kjemisk analyse. Innhold av PAH og tungmetall bestemmes. Hvis PAH-verdiene i alle prøvene er lavere enn SFT sin norm for mest følsomt arealbruk, bør massene kunne deponeres permanent på gatefei-tippen. Gravemassene fra resten av byggegropa er byjord og deponeres på tippen på Tiller uten videre undersøkelsesprogram. Før det settes i gang gravearbeider eller tiltak i forurensset grunn må det søkes om tillatelse fra Fylkesmannen.			

1. INNLEDNING.

Prosjekt På det undersøkte området er det planlagt å bygge parkeringskjeller i to nivå. Tidligere virksomhet på eiendommene kan ha forurensset grunnen. Det er derfor tatt miljøprøver i tillegg til grunnundersøkelsene.

Lokalisering

Undersøkelsene er utført på eiendommene Brattørveita 19/21 og Brattørgata 10/12. Bilag 1 viser oversik over det undersøkte området og omfang av grunnundersøkelsene.

Oppdrag Det er utført orienterende grunnundersøkelser som omfatter totalsondering og prøvetaking. Det er i tillegg tatt miljøprøver for å bestemme innholdet av tungmetaller og den organiske miljøgiften PAH.

2. UTFØRTE UNDERSØKELSER

Feltarbeid Riksantikvitaren har gitt tillatelse til prøvetaking ned til 8 m dybde. Geoteknisk faggruppe har utført totalsonderinger i 5 punkt. Sonderingsdybde er 8 m. Det er tatt opp prøver med skruprøvetaker fra 5 punkt. Børpunktene plassering er vist i bilag 1. Feltarbeidet ble gjort første uka i mai.

I punkt 1, 2 og 5 er det tatt prøver ned til 4 m under overflaten. I punkt 4 er det tatt prøver ned til 1 m dyp, mens det i punkt 3 er tatt prøver helt ned til 8 m dyp. Sondering og prøvetaking er gjort der det tidligere var bakgårder og gårdsplass. Resultatene fra sonderingene er vist i bilag 2. Terrenget i profilene er tegnet på grunnlag av kart.

Prøvetaking i hull 3 viste at grunnvannsstand er 7.5 til 8 m ned i grunnen. Grunnvannsstandsmåler ble derfor ikke innstallert.

Tidligere undersøkelser

Trondheim Kommune har ikke tidligere utført grunnundersøkelser på eller like i nærheten av området.

Laboratorieundersøkelser

Prøvene er undersøkt ved Utbyggingskontorets geotekniske laboratorium. De er beskrevet og klassifisert. Resultatene fra laboratorieundersøkelsene er vist i bilag 3-4.

Det er tatt miljøprøver fra hver meter skruprøve, til sammen 21 prøver. Kjemiske analyser er utført av Tauw laboratorium i Nederland. Hver av prøvene er analysert for innhold av 8 tungmetaller og PAH. To av prøvene er analysert for innhold av PCB.

3. GRUNNFORHOLD

Topografi Området er flatt og ligger på kote 7.

Grunnforhold

Grunnen i midbyen består grovt sett av sand i stor mektighet. De 5 sonderingene og prøvetakingene viser at grunnen består av lagdelt sand, grus og noe silt.

I hull 1 er det funnet tegl, humus, kalk, kull og oljelignende materiale i de øverste 3 m av prøvestrengen. I hull 2 er det funnet tre og teglrester i prøven som er tatt 1 til 2 m under terreng. I hull 3 er det tegl, kalk og humusrester i materialet fra 2 til 4 m ned i grunnen. I hull 5 virket prøven fra den øverste meteren noe fourenset. Alt i alt tyder grunnundersøkelsene på at det er mye innfylte masser på tomte.

Grunnvann

Feltundersøkelsene inkluderte ikke grunnvannsstandsmålinger, men i hull 3 står grunnvannet på ca kote 0. Dette er noe lavere enn forventet. Ut fra kjennskap til grunnvannsstand andre steder i sentrum, ville en vente at grunnvannstand lå på kote +1 til +2 m.

Fjell

Fjell er ikke påtruffet. I krysset mellom Danielsbakerveita og Brattørveita har Kummeneje sondert til 20 m uten å treffe fjell. Dybde til fjell er stor.

4. FORURENSET GRUNN

Analyseresultater

Målte forurensningskonsentrasjoner er vist i bilag 4. Det viser også SFTs normverdier for mest følsomt arealbruk og bakgrunnsverdier for overflatejord i Trondheim. Tabellen nedenfor oppsummerer resultatene fra undersøkelsene.

Hull	Tungmetaller	Organisk
1	1-3 m: blyinnhold opp til 5 x SFT norm	ok
2	2-3 m: sink 3x SFT norm	ok
3	1-2 m: sink 4x SFT norm 1-2 m: kvikksølv 4 x normalt for overflatejord i Trondheim, men laverer enn SFT norm.	1-8 m: Høyere PAH enn normalt for overflatejord i Trondheim 1-2 m: PAH 5x SFT norm. 1-2 m: B(a)P 7x SFT norm
4	ok	ok
5	ok	ok

To prøver ble analysert for innhold av PCB, men det er ikke funnet PCB over deteksjonsgrensen for analysene.

5. VURDERINGER

Graving Byggegropa må spundes. Det er generelt gode graveforhold på tomta med lav grunnvannsstand i grus og sand. Ved bygging av parkeringshus i to etasjer vil imidlertid nederste kjellerplan komme nær grunnvannsnivå. Det er sonderet til 8 m dybde i 5 punkt uten problem. Slag ble bare brukt i to punkt. På en brannomt med innfylte masser kan det likevel ikke utelukkes at det finns bygningsavfall eller annet som kan gi problem i forbindelse med spunting.

Fundamentering

Fundamenteringsforholdene på området er gode.

Forurensning

Forurensningsproblemet er først og fremst knyttet til hull 3 hvor innholdet av PAH og B(a)P i prøven fra 1 til 2 meter er hhv 5 og 7 ganger høyere enn SFT sin norm for mest følsomt arealbruk. I prøvene fra 1 til 7 meter er PAH-innholdet generelt høyere enn det som er normalt for overflatejord i Trondheim. I tillegg er det spor av kvikksølv.

Analysene har vist at det kun er noen prøver utenfor punkt 3 som er lett til moderat forurenset med tungmetaller. I hull 2 er en prøve lett forurenset av sink, i hull 2 er 2 prøver moderat forurenset av bly.

Deponering av masser

Massene fra hoveddelen av byggegropa er byjord og bør kunne deponeres på gatefei-tippen på Tiller.

Massene nærmest hull 3 må kjøres til mellomlager hvor de lagres på duk og tildekkes med vanntett presenning. Det må gjøres kjemiske analyser for å bestemme hvor materialet kan deponeres. Et område inne på gatefei-tippen kan benyttes til mellomlager. Det tas blande-prøver fra massene og PAH- og tungmetallinnhold bestemmes. Hvis PAH-verdiene i alle prøvene fra mellomlageret er lavere enn SFT sin norm for mest følsomt arealbruk, bør massene kunne deponeres permanent på gatefei-tippen.

Før det settes i gang gravearbeider eller tiltak i forurensset grunn må det søkes om tillatelse fra Fylkesmannen.

Ms Ing. C. Spa (+ 31-570699763)

Please find enclosed the results of our laboratory tests. Unless stated otherwise, the accredited analyses were carried out using the methods listed in the most recent version of the compilation, by the Dutch Council for Accreditation, of analyses performed by Tauw.

Allow us to draw your attention to the fact that the report enclosed may only be reproduced in its entirety. The reproduction of parts of the report is subject to the written approval from the undersigned.

Should you require any further information, please do not hesitate to contact the after-sales department.

We trust that the enclosed information will meet with your requirements.

Yours sincerely,

Tauw laboratorium

page 4 of 4

Concerning : Projectnumber : 6087301
 Analytical code : 968248

Explanation of the letter codes given between brackets

- (h) : Given the interfering influence of the sample matrix the limit of determination is increased.
- (m) : It is difficult to quantify this component due to interfering compounds in the sample. If this component is present, its concentration will not exceed the reported value.
- (mp) : This analysis is carried out by means of gas chromatography-mass spectrometry. Selectivity is attained using 1 capillary column in combination with the specific mass of the detector. In theory, this combination allows for a co-elution of PCB-28 - if any - with PCB-31, of PCB-52 with PCB-69, of PCB-138 with PCB-163 and of PCB-153 with PCB-168.
