## Nivellement - Ladebekken bru.

De nye boltene i Ladebekken bru, i alt 14 stk., er nå høydebestemt i forhold til en ny fjellbolt i Ladehammervegen. Da det foreløbig ikke finnes eksakt høyde på denne bolten, har jeg her satt høyden på den til 0, og beregnet høyden på boltene i brua ut fra det. Høyden på de nye boltene blir da:

|        |             |        |             |         |             |
|--------|-------------|--------|-------------|---------|-------------|
| Bolt 1 | H = 2,862 m | Bolt 6 | H = 2,960 m | Bolt 11 | H = 9,228 m |
| 2      | H = 2,739 " | 7      | H = 3,004 " | 12      | H = 9,250 " |
| 3      | H = 2,680 " | 8      | H = 3,090 " | 13      | H = 9,589 " |
| 4      | H = 2,852 " | 9      | H = 8,720 " | 14      | H = 9,372 " |
| 5      | H = 3,002 " | 10     | H = 9,201 " |         |             |

## Lade.

Stein eller fjell

Leiren er meget lite sensitiv

På grunnlag av de ufullstendige målinger kan det antydes et tillatt fundamenttrykk

$$q_a = \cancel{1,0 \text{ kg/cm}^2} \cdot 4,3 \text{ kg/m}^2$$

Sikkerheten er da regnet lik 1,5.

$$q_a = N_c \frac{s}{F} + \gamma \cdot D$$

$$= 4,0 \text{ kg/cm}^2 + 3,3 \text{ kg/m}^2$$

$$= 4,0 \text{ kg/cm}^2 + 0,33 \text{ kg/cm}^2$$

Til sammenlikning kan opplyses at en

fylling på 10 m's høyde gir et trykk på

$$q = 2,2 \text{ kg/cm}^2$$

Hans Strøm
